

HER VOICE

Her Voice is a digital concept focused on creating a supportive and accessible environment where women can access information, support and resources. The project was designed around the idea that digital experiences dealing with sensitive topics must prioritise trust, privacy, clarity and emotional safety.

Role

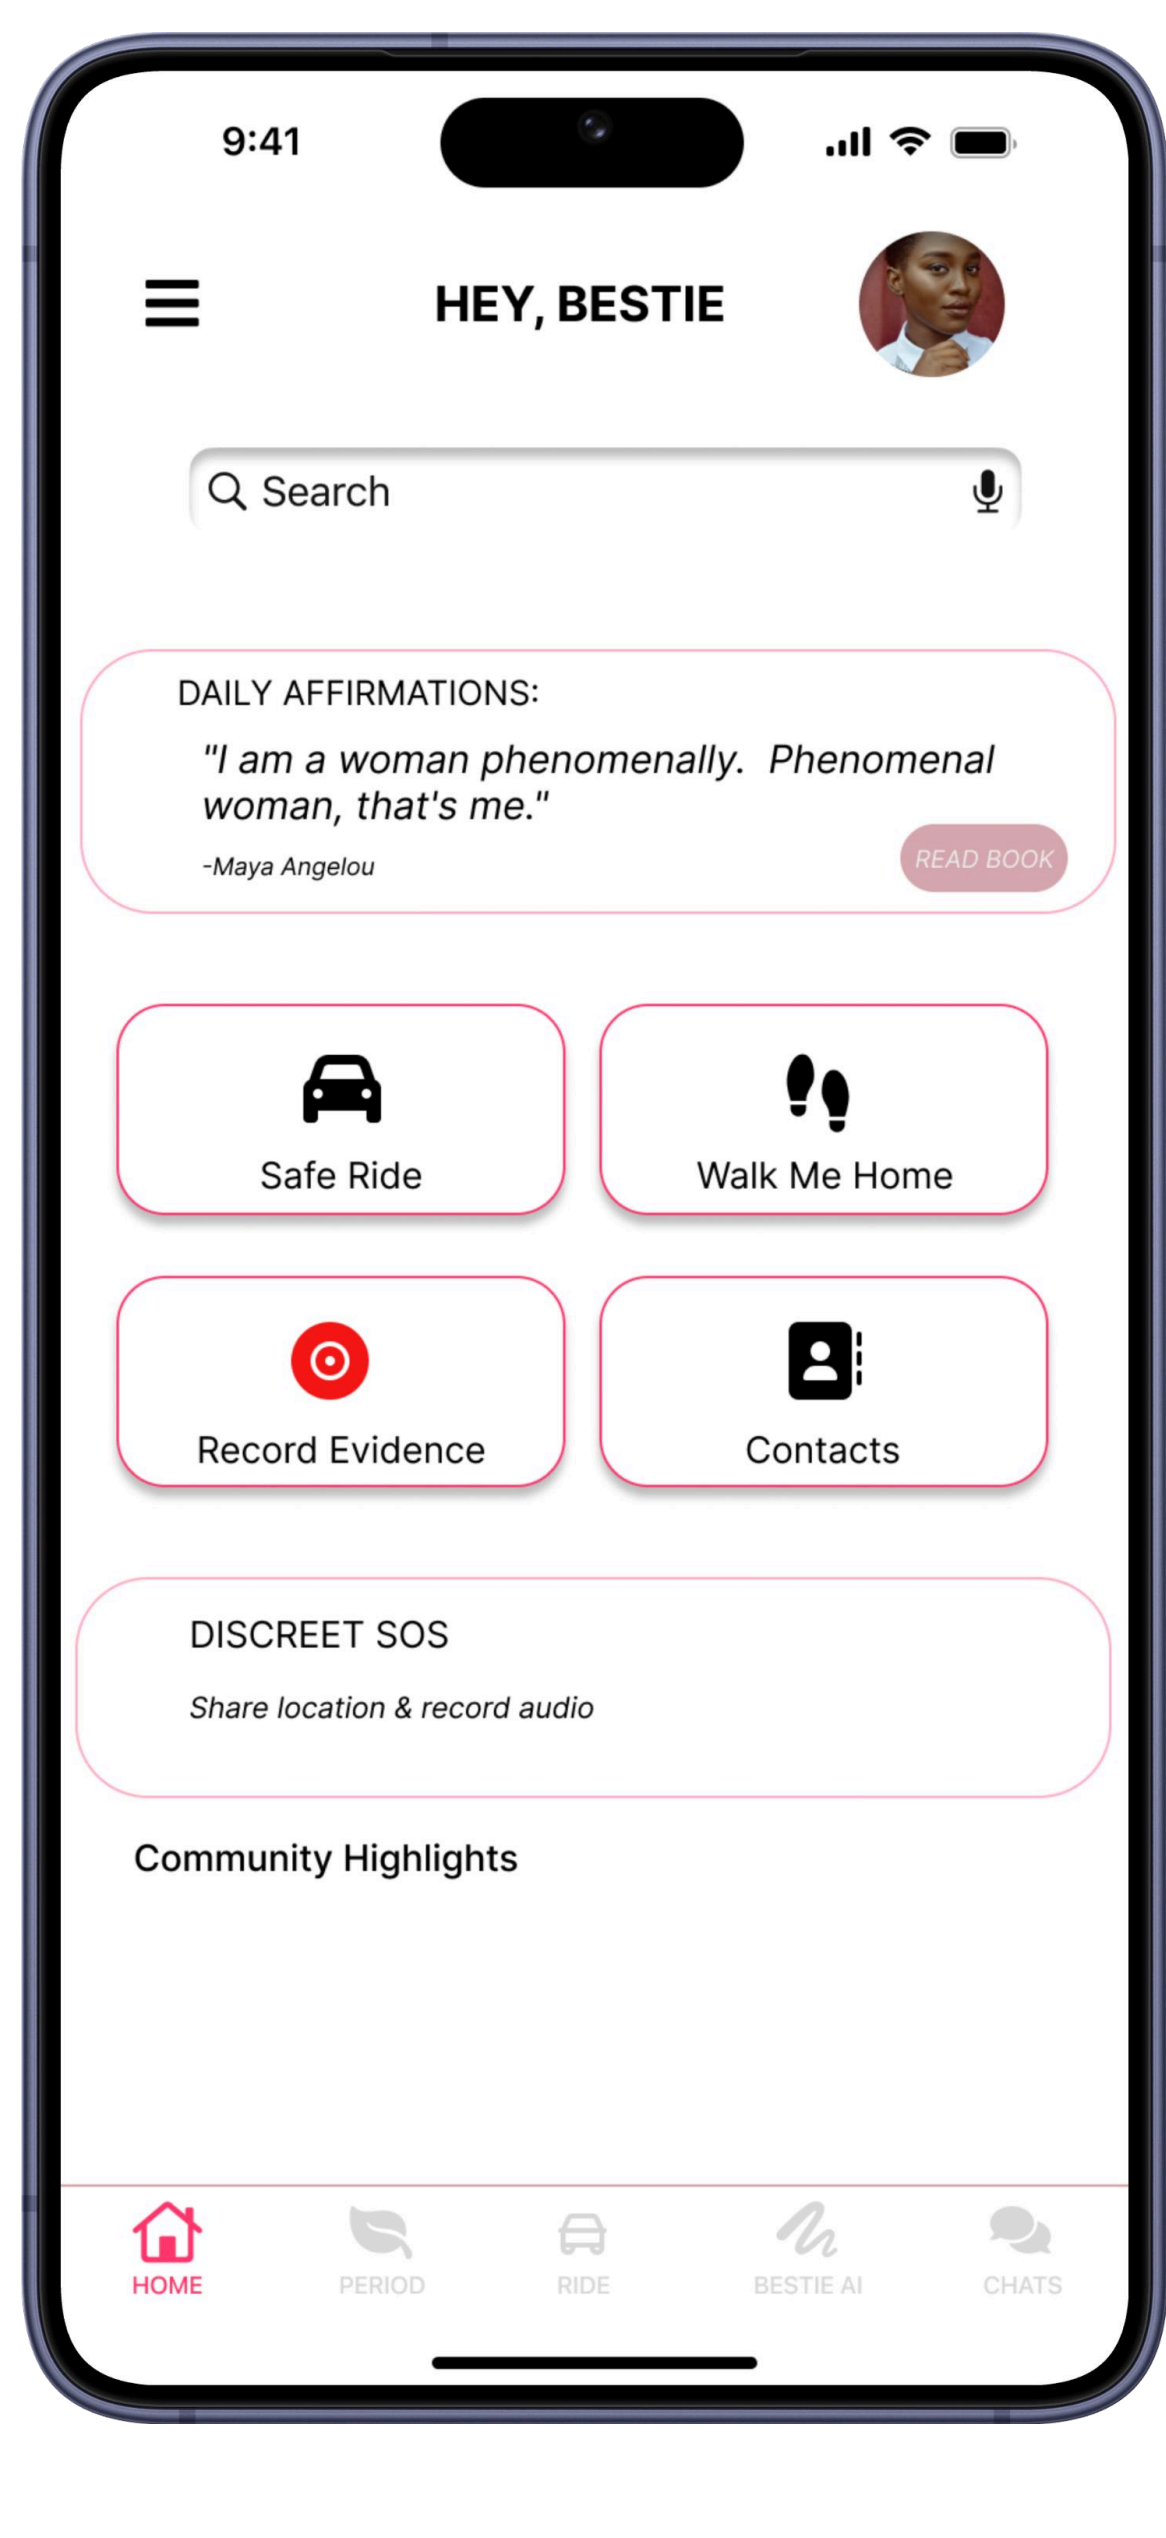

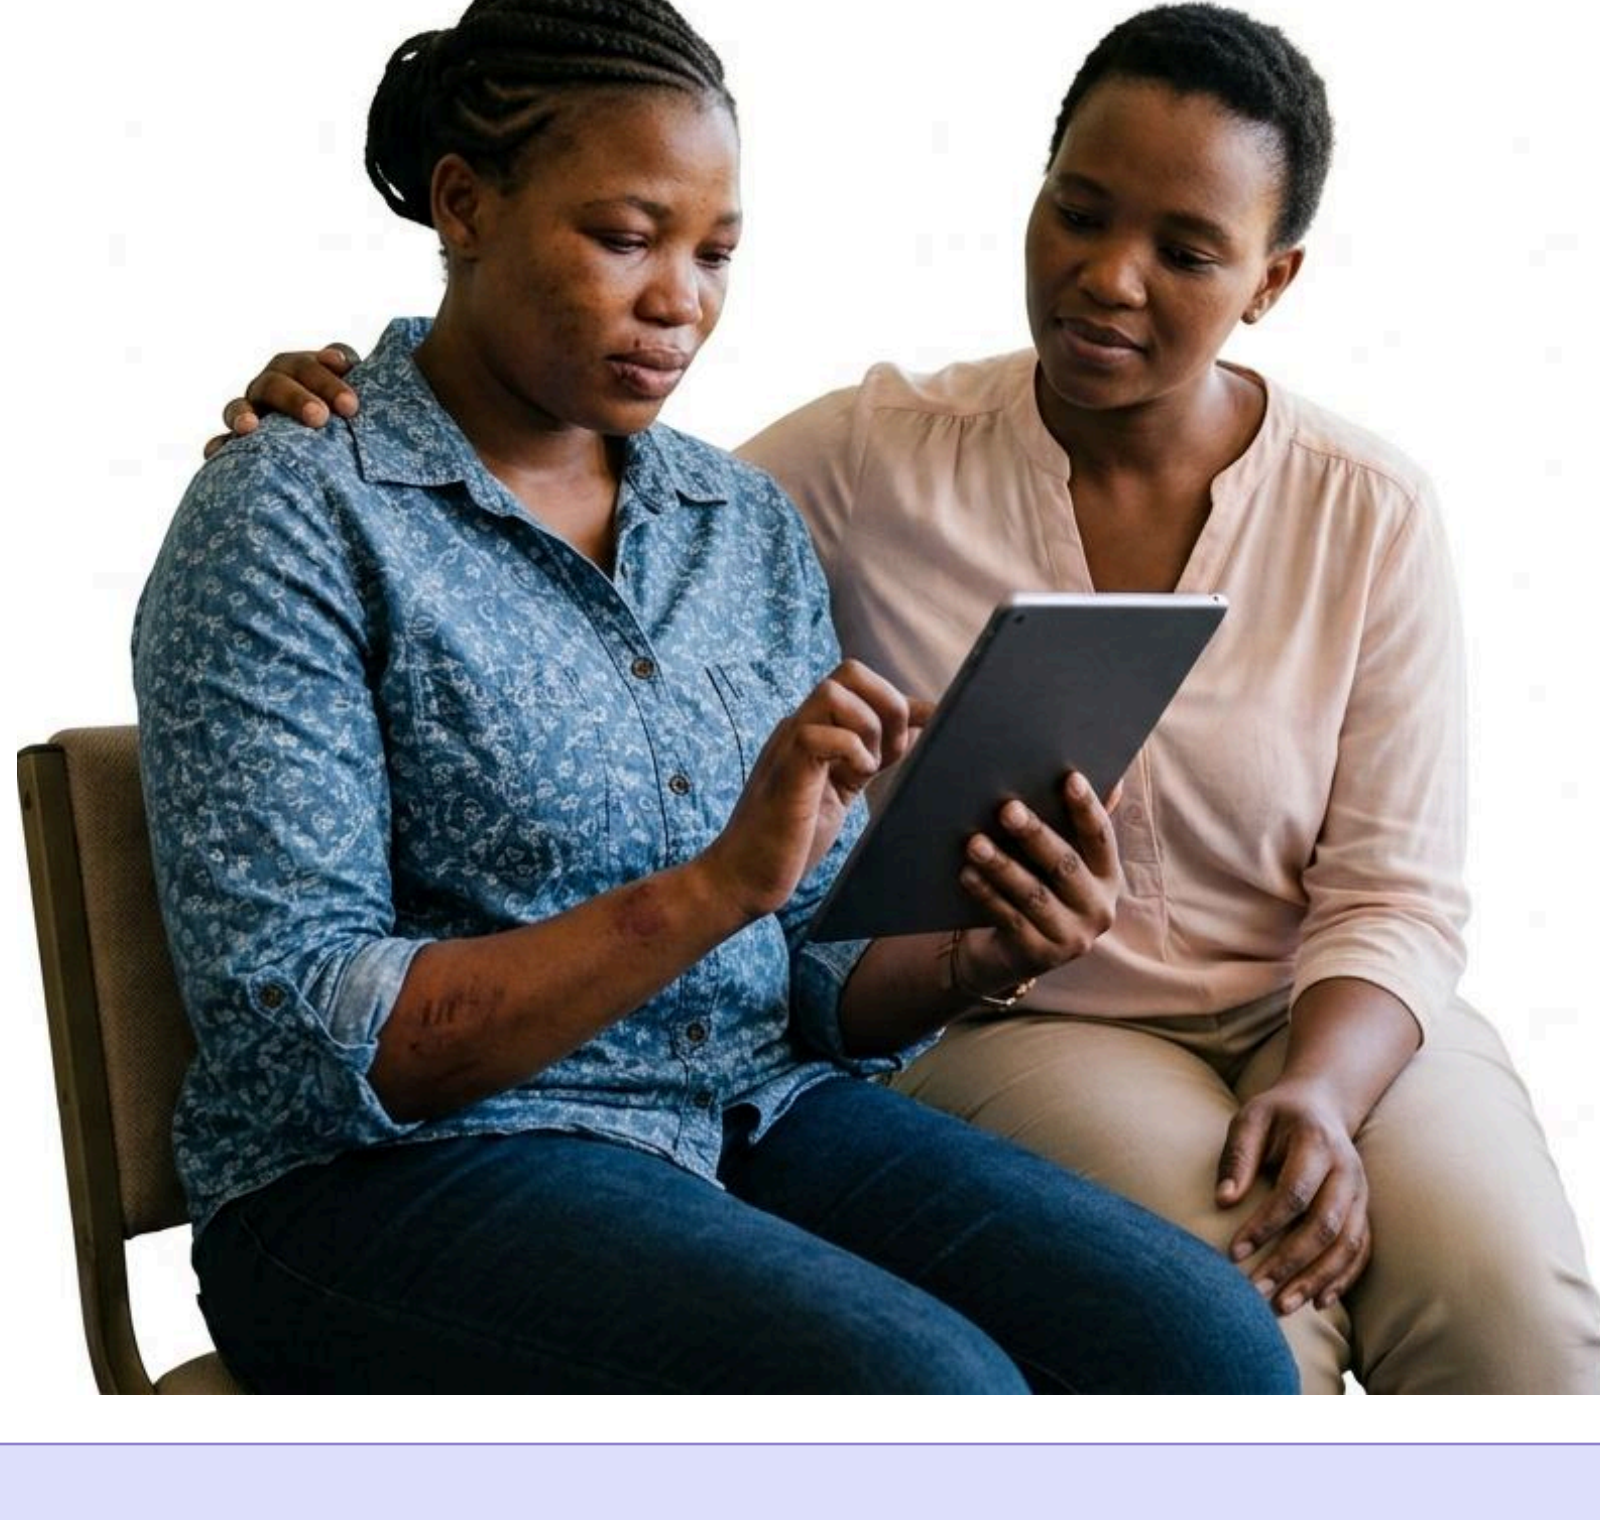

UX/UI Designer

Duration

8 Weeks

Tool

Figma

Project Overview

Her Voice is a mobile application created to empower, protect, and support women in their daily lives. Born out of the need to address gender-based violence (GBV) and health challenges faced by women, the app integrates safety, wellness, and AI-driven support into one trusted platform.

The Design Journey

Empathize

Understand women's needs, concerns and barriers.

Define

Identify the key problems preventing users from accessing support.

Ideate

Develop solutions that make information and support easier to reach.

Prototype

Design the core user experience.

Test

Evaluate usability, clarity and confidence.

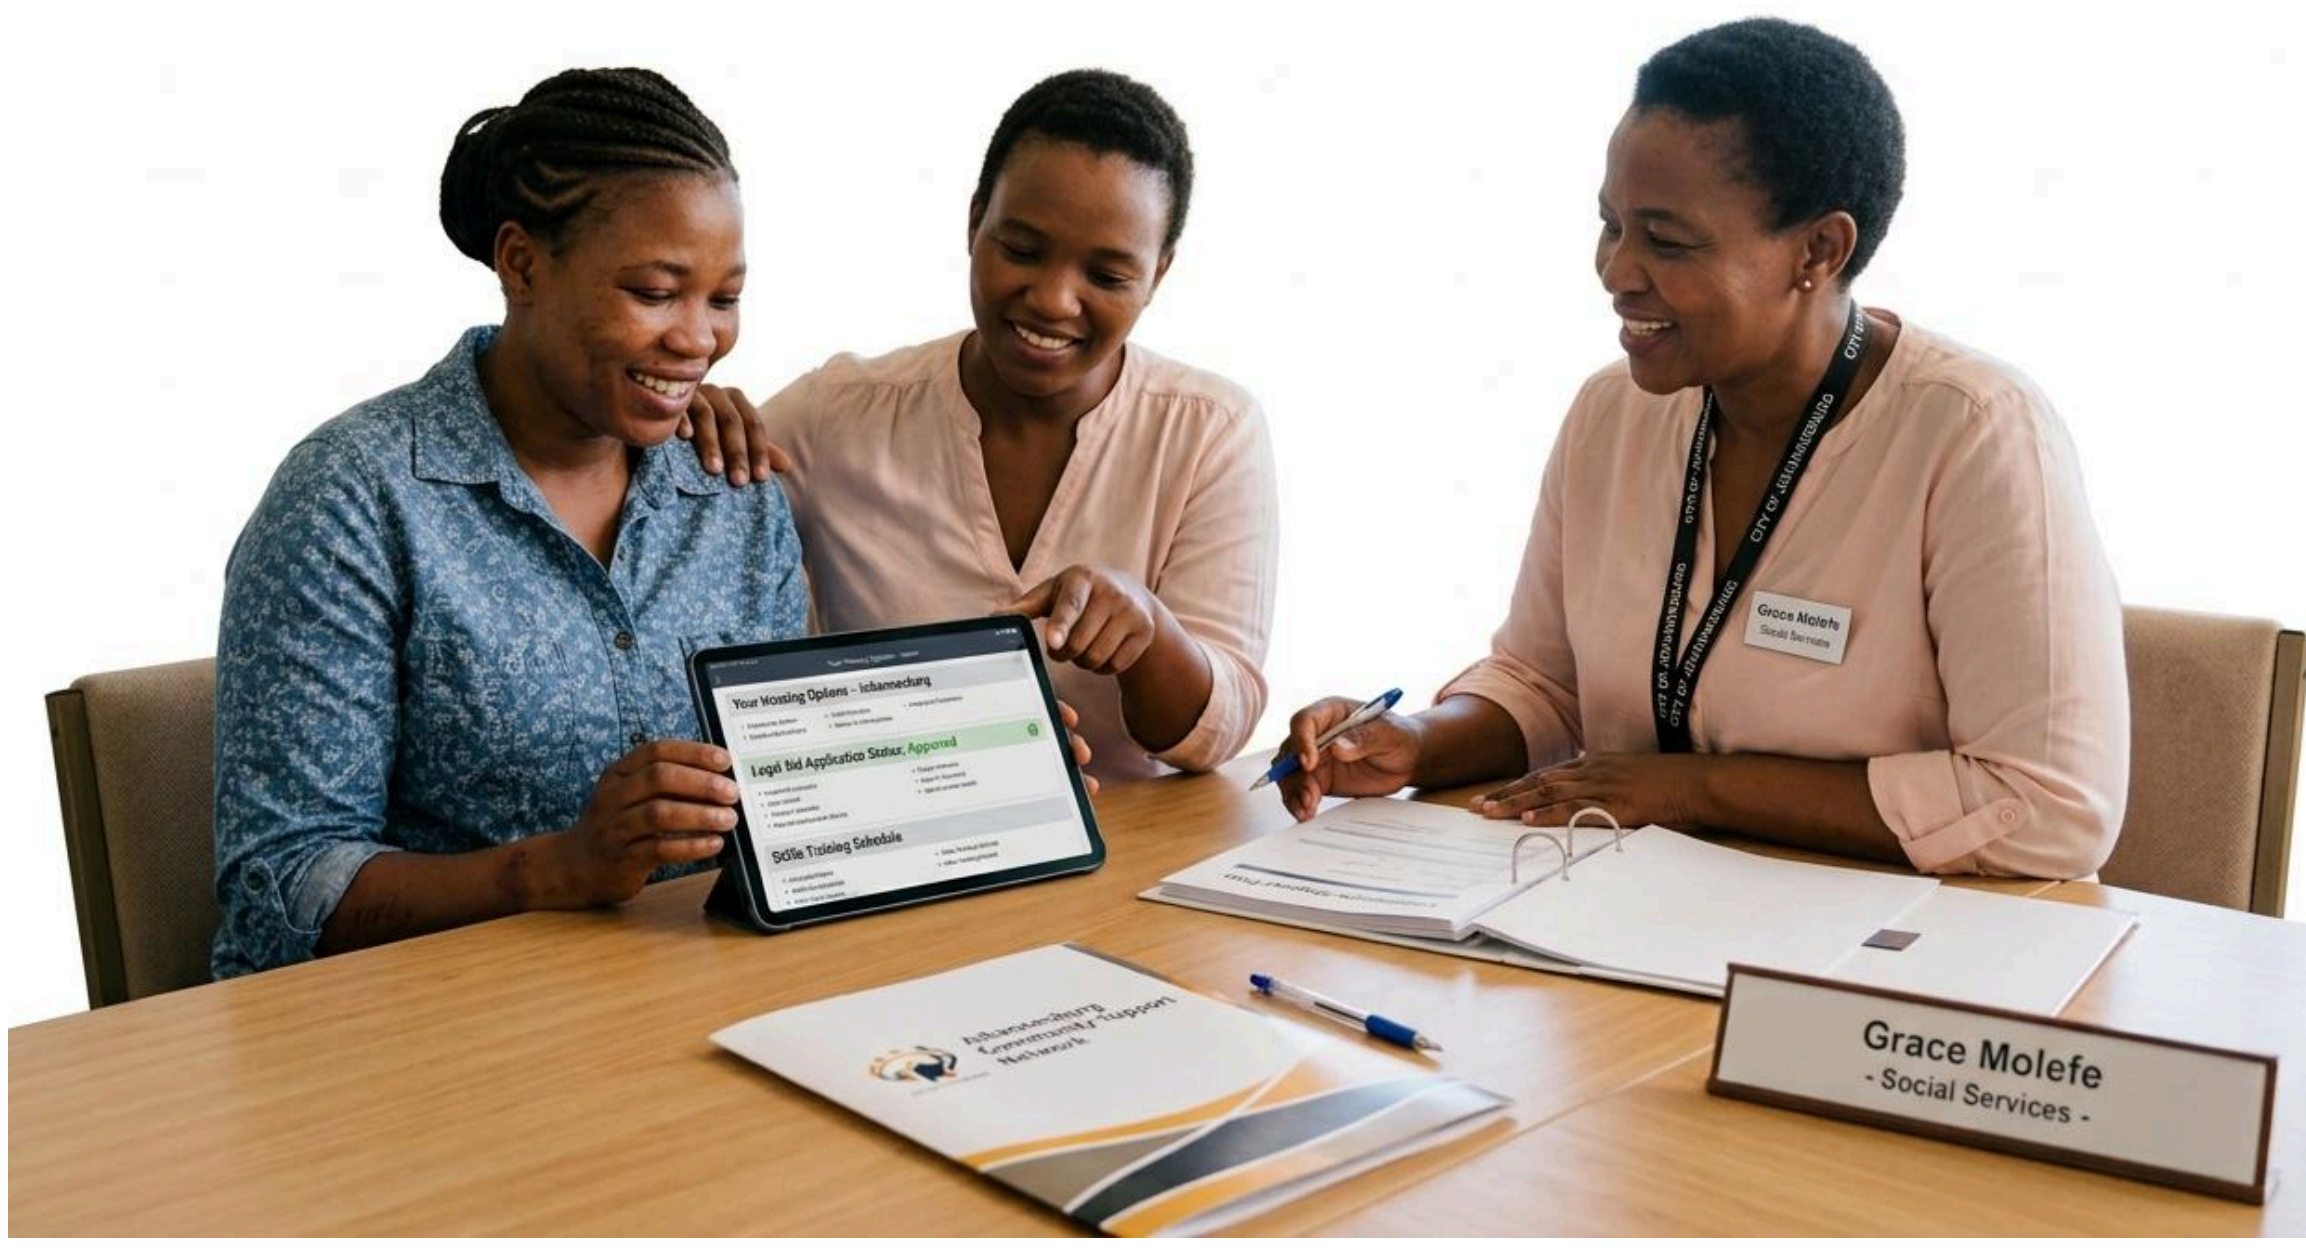

Empathy

Designing For Trust

When users seek support around sensitive issues, the experience needs to feel safe.

The research therefore considered:

- Privacy
- Accessibility
- Emotional safety
- Trust
- Ease of navigation
- Access to reliable information

Define

Information Should Not Be Another Barrier

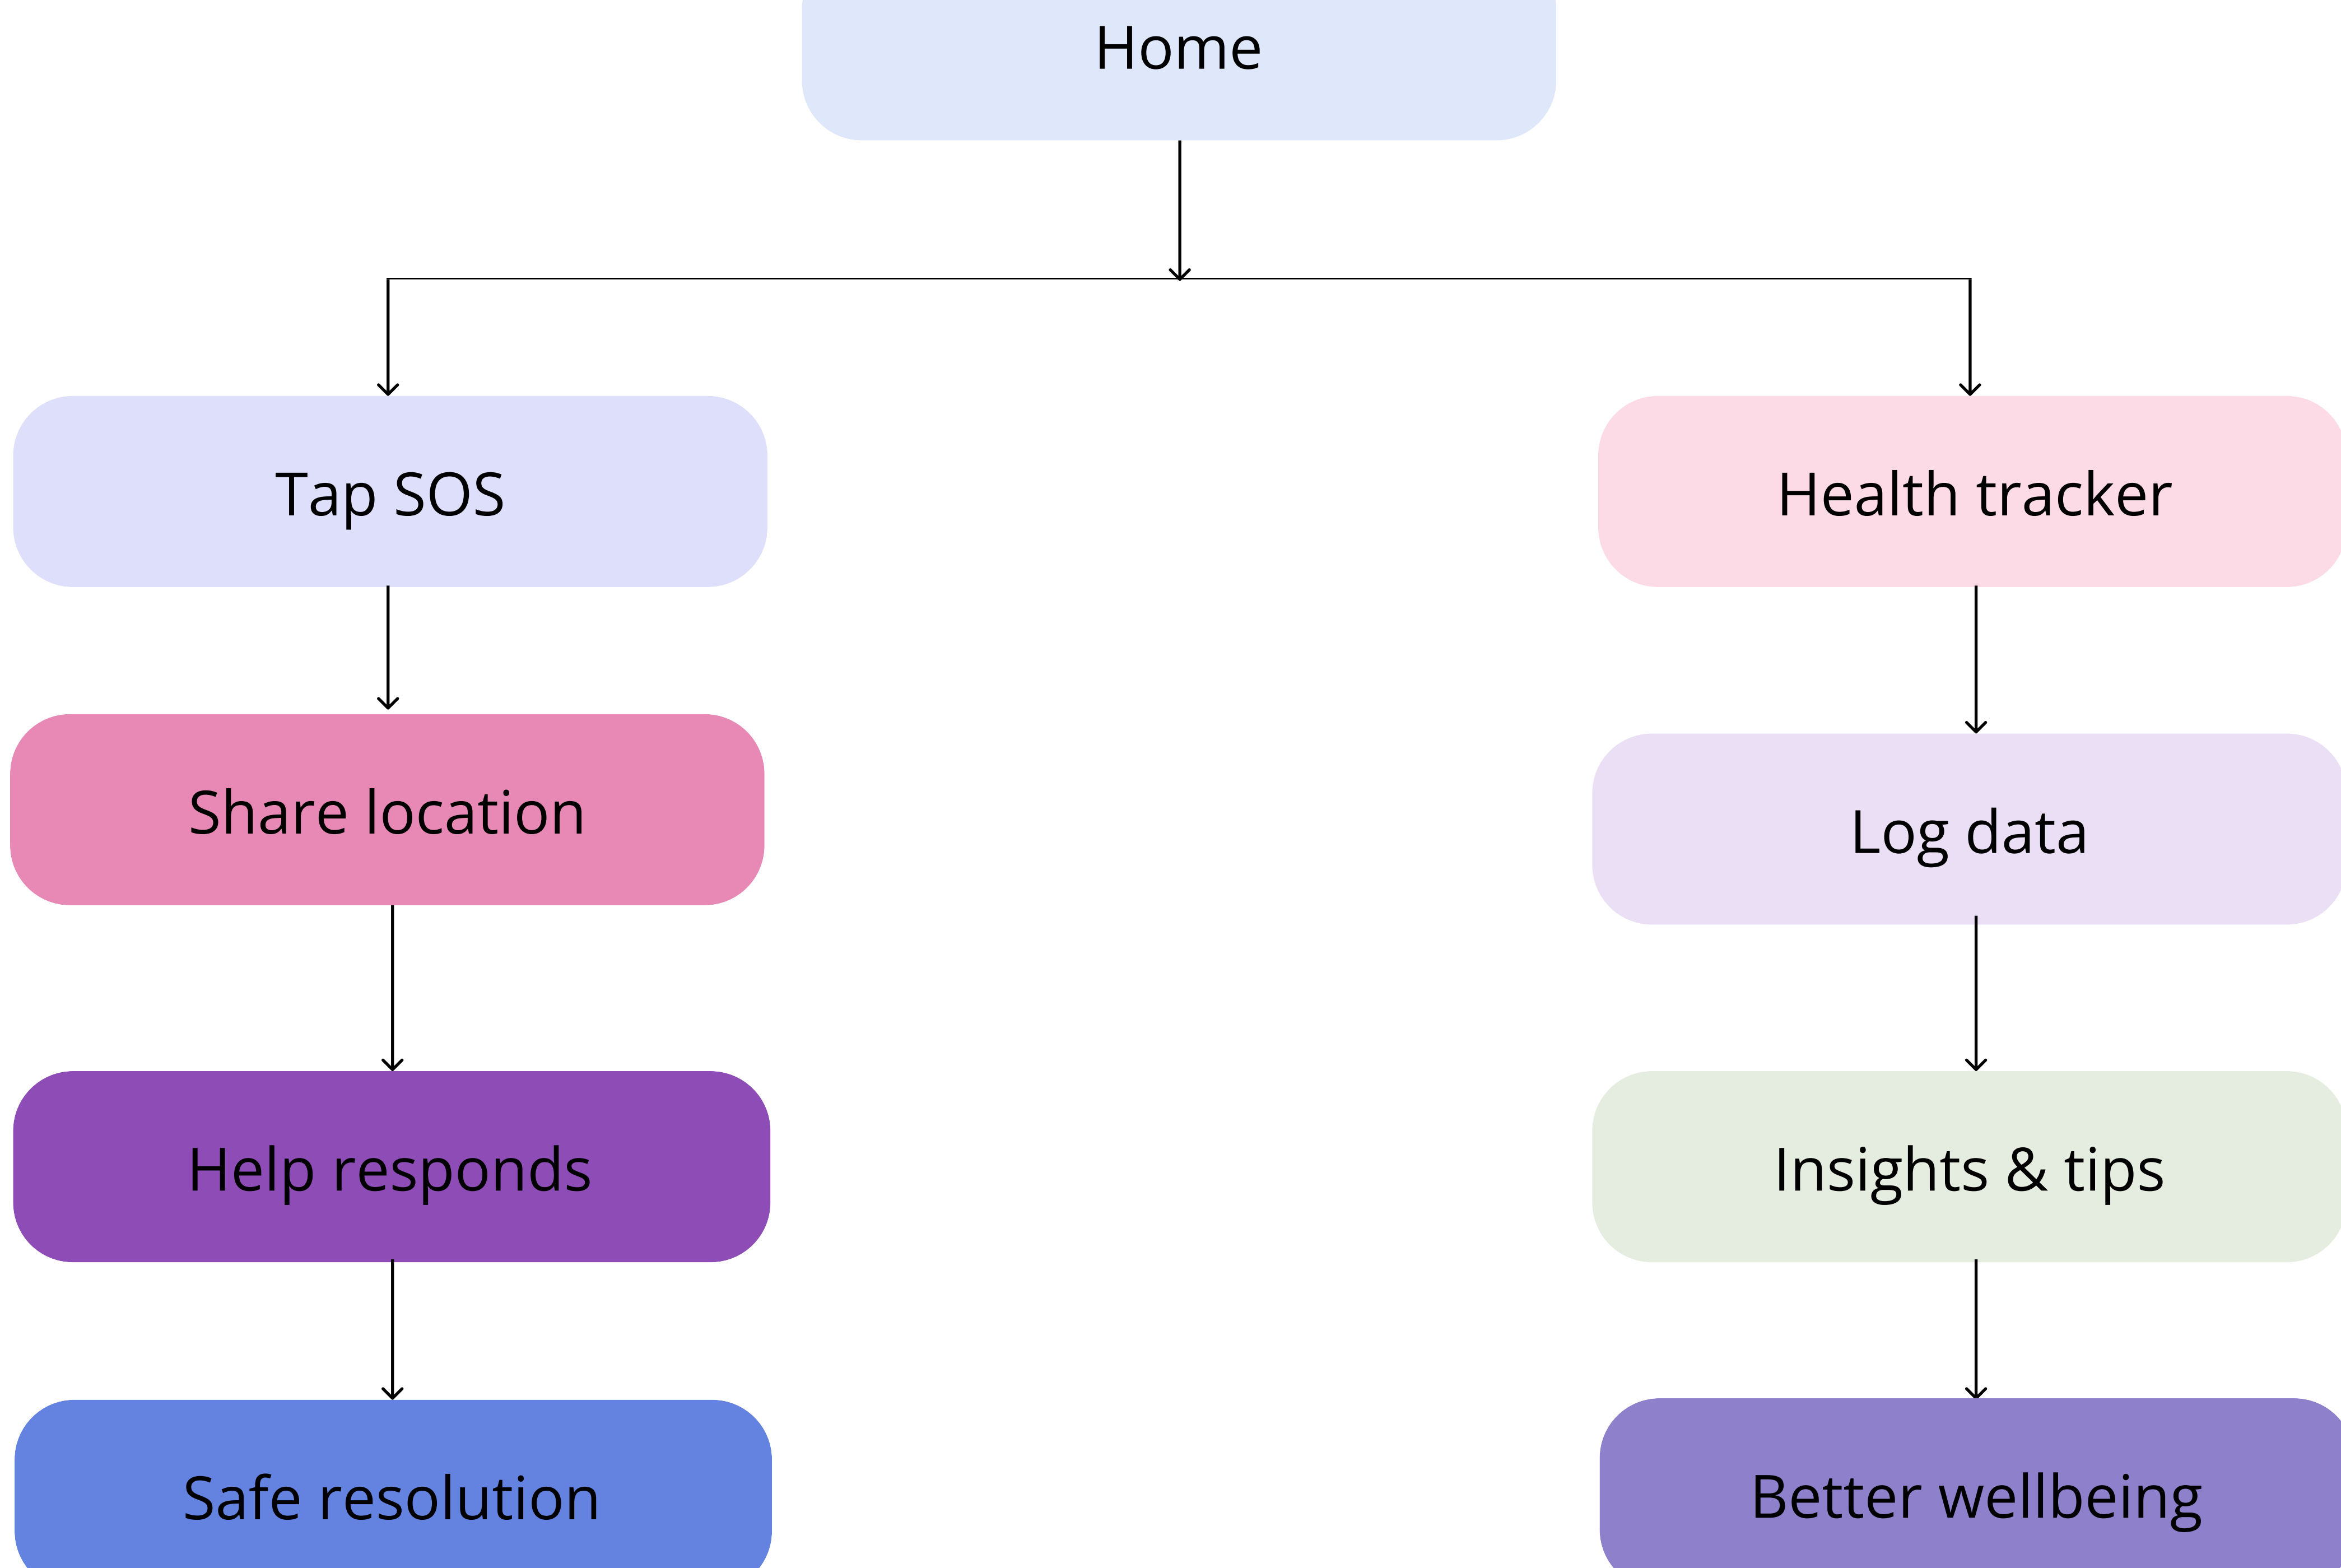

Users should not have to navigate a complicated system when looking for help or information.

The design challenge was therefore to create a straightforward experience where users can quickly understand:

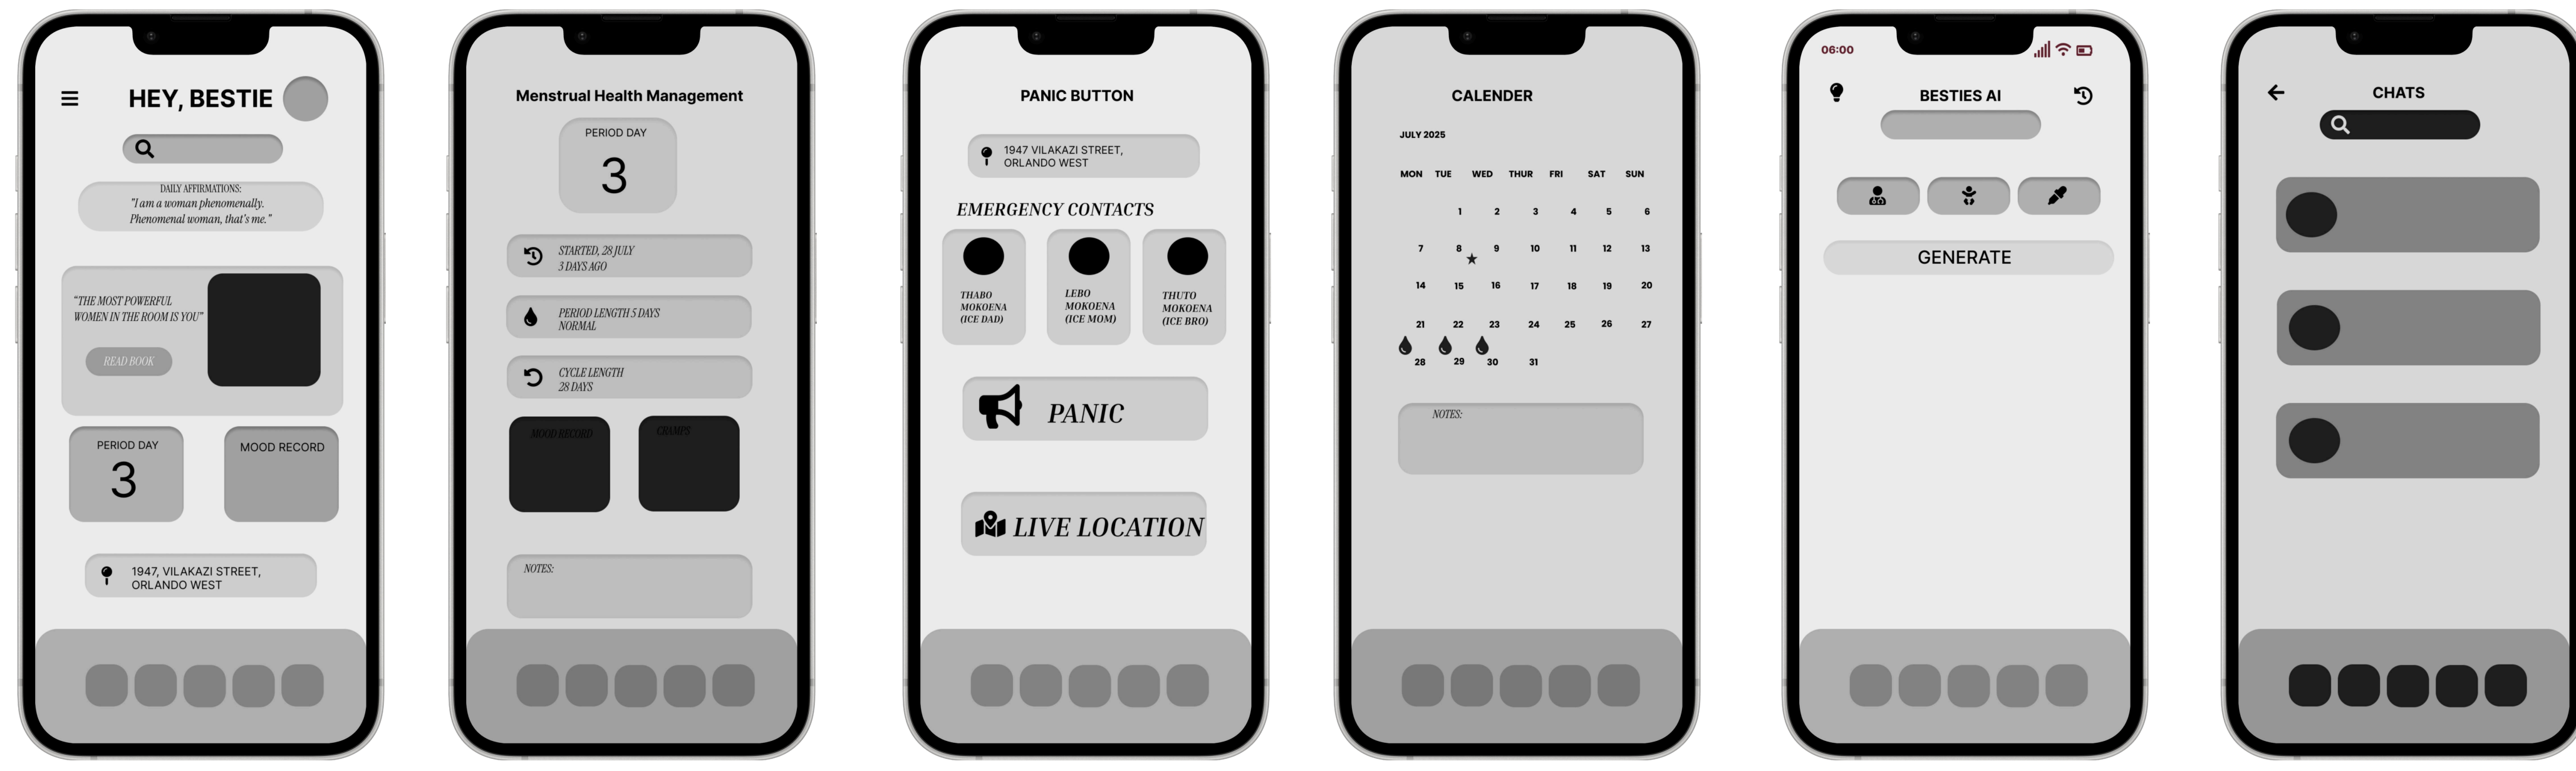

Ideate

User Flow (Book an Appointment and Request Support.Journey)

Low- Fidelity Screens

Test

Usability Testing

I conducted an unmoderated study with women to understand how they navigate Her Voice. The goal was to identify usability issues, points of confusion, and opportunities to build trust, privacy and quick access to help.

Unmoderated study

45 minutes

5 participants

Women

What women said during testing

"The SOS button was easy to find, but I wanted to know who gets notified.

"I liked the resources page, but I wasn't sure which articles were most relevant to me.

"Everything felt private, I appreciated that nothing showed on my lock screen.

"It feels safe and easy to use.

From feedback to design

Improvement Recommendations

Strengthen privacy controls by hiding sensitive notifications from the lock screen and adding a quick-exit gesture, so the app stays discreet in unsafe situations.

Clarify support paths by separating emergency actions from everyday wellness features, so users aren't searching for help in a moment of crisis.

Streamline navigation by keeping the SOS button in a consistent, always-visible location, so it's never more than one tap away.

"It feels safe and easy to use." Keep the calm, uncluttered interface, since it's already earning the trust the app depends on.

What We learned

Key Takeaways

Design for the moment of crisis, not just everyday use. A wellness app and a safety app ask very different things of an interface, one needs warmth and detail, the other needs speed and discretion. Her Voice had to hold both without either one compromising the other, so safety features stayed fast and separate while everyday features stayed personal and rich.
