

SHELL VELOCITY

Earn. Travel. Pay It Forward

Shell Velocity explores a digital experience designed around the relationship between drivers, mobility and convenience. The project focuses on simplifying interactions and creating a more seamless experience for users who rely on digital services while travelling.

Role

UX/UI Designer

Duration

8 Weeks

Tool

Figma

Project Overview

Teachora is a paperless school communication platform designed to connect **teachers, parents and learners** in one digital environment. The product brings together school communication, announcements, calenders, reminders and an AI-powered tutoring experience designed around the South African CAPS curriculum. The project focused on reducing communication gaps between schools and parent while creating a more connected digital learning experience.

The Design Journey

Empathize

Understand the needs and frustrations of everyday drivers.

Define

Identify opportunities to simplify the user's journey.

Ideate

Explore ways to make essential information easier to access.

Prototype

Develop the proposed digital experience.

Test

Evaluate usability and navigation.

Empathy

Understanding the Driver

Drivers interact with mobility services while often being:

- Time-conscious
- Task-focused
- On the move
- Looking for quick information
- Expecting minimal friction

The design therefore needed to prioritise speed, clarity and convenience.

Define

Reducing Friction

The design challenge was to create an experience where users can quickly find what they need without navigating through unnecessary information.

The experience prioritises:

Clear navigation

Relevant information

Fast interactions

Consistent visual hierarchy

Mobile-friendly behaviour

Ideate

A More Seamless Journey

Low- Fidelity Screens

Test

Usability Testing

I conducted an unmoderated study with drivers to understand how they navigate Shell Velocity. The goal was to identify usability issues, points of confusion, and opportunities to make fuelling faster and rewards clearer.

Unmoderated study

60 minutes

6 participants

Drivers

What drivers said during testing

"Finding a nearby station was fast, but I wasn't sure which rewards applied there."

"The rewards page is nice, but redeeming took more taps than I expected."

"I like being able to donate points, but I want to see the impact after I give."

"I can find a station and pay without any hassle."

From feedback to design

Improvement Recommendations

Reduce steps to pay by combining station selection and payment into a single flow, so drivers can pay before they've finished fuelling.

Simplify navigation by prioritising the most-used actions like find a station, pay on the home screen instead of burying them in menus.

Improve offer visibility by surfacing personalised rewards near the top of the dashboard, so drivers see relevant offers before starting a trip.

"I can find a station and pay without any hassle." Keep the streamlined payment flow, since it's already removing the friction drivers cared about most.

What We learned

Key Takeaways

Design for the pump, not the phone. Drivers use this app in short, high-pressure moments or mid-drive, at the pump, already running late. Every extra tap costs more here than in a typical app, so the redesign had to prioritise speed and visibility over feature depth.
