

# TEACHORA

## Beyond the Classroom

Teachora is a paperless school communication app designed to improve engagement between teachers and parents. The app provides a central hub for announcements, notices, and private communication.

### Role

UX/UI Designer

### Duration

8 Weeks

### Tool

Figma

## Project Overview

Teachora is a paperless school communication platform designed to connect **teachers, parents and learners** in one digital environment. The product brings together school communication, announcements, calendars, reminders and an AI-powered tutoring experience designed around the South African CAPS curriculum. The project focused on reducing communication gaps between schools and parent while creating a more connected digital learning experience.

## The Design Journey

### Empathize

Understand the communication challenges experience

### Define

Identify where existing communication methods create friction.

### Ideate

Develop a centralized school communication experience

### Prototype

Create the Teachora interface and interaction flows.

### Test

Evaluate whether users can easily find school information and complete important tasks.

## Empathy

### Understanding the Problem

#### Connecting School and Home

Parents often receive important school information through multiple channels.

Announcements, messages, calendars, reminders and learner-related information can become difficult to keep track of.

Teachora was designed around the opportunity to create one central place for school communication.

The experience considers:

- Parents
- Teachers
- Learners
- School administrators

## Define

### The Communication Gap

The core problem was not necessarily a lack of communication, it was the fragmentation of communication. Important information can become difficult to find when it is spread across different platforms.

Teachora therefore aims to provide:

## Ideate

### User Flow (Parent Journey)

## Low- Fidelity Screens

## Test

### Usability Testing

I conducted an unmoderated study with parents and teachers to understand how they navigate Teachora. The goal was to identify usability issues, points of confusion, and opportunities to make communication clearer.

### What parents and teachers said during testing

## From feedback to design

### Improvement Recommendations

## What We learned

### Key Takeaways

Design for clarity, not just centralisation. Bringing every channel into one app isn't enough if parents still have to guess what needs their attention. For a school communication platform, the interface needs to make responsibility clear (what to read, what to act on, and what's just for information) not simply reduce the number of apps in someone's day.
